Module Two Assignment

For this module, I've discovered and now understand that code review is the process of analyzing and understanding existing code to identify weaknesses, inefficiencies, vulnerabilities, and areas that can be improved. Code review is extremely important for computer science professionals because it improves software quality, consistency, and maintainability, ultimately enhancing the system as a whole. Additionally, it facilitates smoother collaboration between developers and simplifies the code, making it more understandable to others. Some important code review practices include checking code structure, documentation, defensive programming, repeated logic, hard-coded values, and overall efficiency. Code reviews should occur throughout the development process rather than only at the end because identifying issues earlier makes debugging and improvements significantly easier later in the software development lifecycle. During my own review process, I noticed the importance of organization and modularity, especially in larger projects where poor structures can quickly make debugging difficult.

For my code review recording, I will use OBS Studio, as I am familiar with it, and will record both my screen and microphone, while also demonstrating the project and explaining its source code. My artifact is my OpenGL 3D scene project from CS 330 Computational Graphics and Visualization. For my software engineering and design, I will focus on developing modular rendering functions, implementing lighting systems, and optimizing project organization. For algorithms and data structures, I will discuss the render loop, camera movement logic, transformations, and how the scene could become more structured with vectors. For databases, the project doesn't fully use one. I plan to explain how object data, such as positions, textures, and materials, could be stored externally to improve scalability and organization. This project

aligns closely with my career goals in graphics programming and technical art, as it combines both visual design and software engineering concepts.
